Three Big Things

Learn From Log4Shell

Log4Shell Rewind

I posted this in December 2021 right after log4shell dropped

Almost a year later, October 2022 I presented “learn from log4shell” at devopsdays houston, I had basically given up and said this was completely wrong

Now it may end up being correct, but not in the way I thought

<https://twitter.com/CubicleApril/status/1469825942684160004>

https://www.linkedin.com/posts/novarese_log4j-log4shell-activity-6876206319238463488-8bEA

Paul Novarese

SBOMs and Software Supply Chain Management at Anchore

2y · Edited

...

The **#log4j** debacle is going to have ramifications far beyond the vulnerability itself. There has been a lot of inertia in how issues are evaluated and classified, how information about those issues is disseminated, and how organizations respond to them, and **#log4shell** has exposed a lot of these problems. This will be a catalyst for a lot of changes that are way overdue.

April King

@CubicleApril

...

The fact that there are almost 10,000 CVEs with the same CVSS score as the Log4j vulnerability suggests to me that maybe the scale should be logarithmic.

The State of Log4Shell Today

Log4Shell Today

It's been over two years and log4shell is still the single most exploited CVE

Data from CISA - cybersecurity and infrastructure security agency
<https://www.cisa.gov/news-events/cybersecurity-advisories/aa22-279a>

Table I: Top CVEs most used by Chinese state-sponsored cyber actors since 2020

Vendor	CVE	Vulnerability Type
Apache Log4j	CVE-2021-44228	Remote Code Execution
Pulse Connect Secure	CVE-2019-11510	Arbitrary File Read
GitLab CE/EE	CVE-2021-22205	Remote Code Execution
Atlassian	CVE-2022-26134	Remote Code Execution
Microsoft Exchange	CVE-2021-26855	Remote Code Execution

Fukushima Daiichi

Incident: 2011

Cleanup: at LEAST thirty years

**Chernobyl
Incident: 1986
Cleanup: at LEAST until 2065**

Hidden Risk in the Software Supply Chain

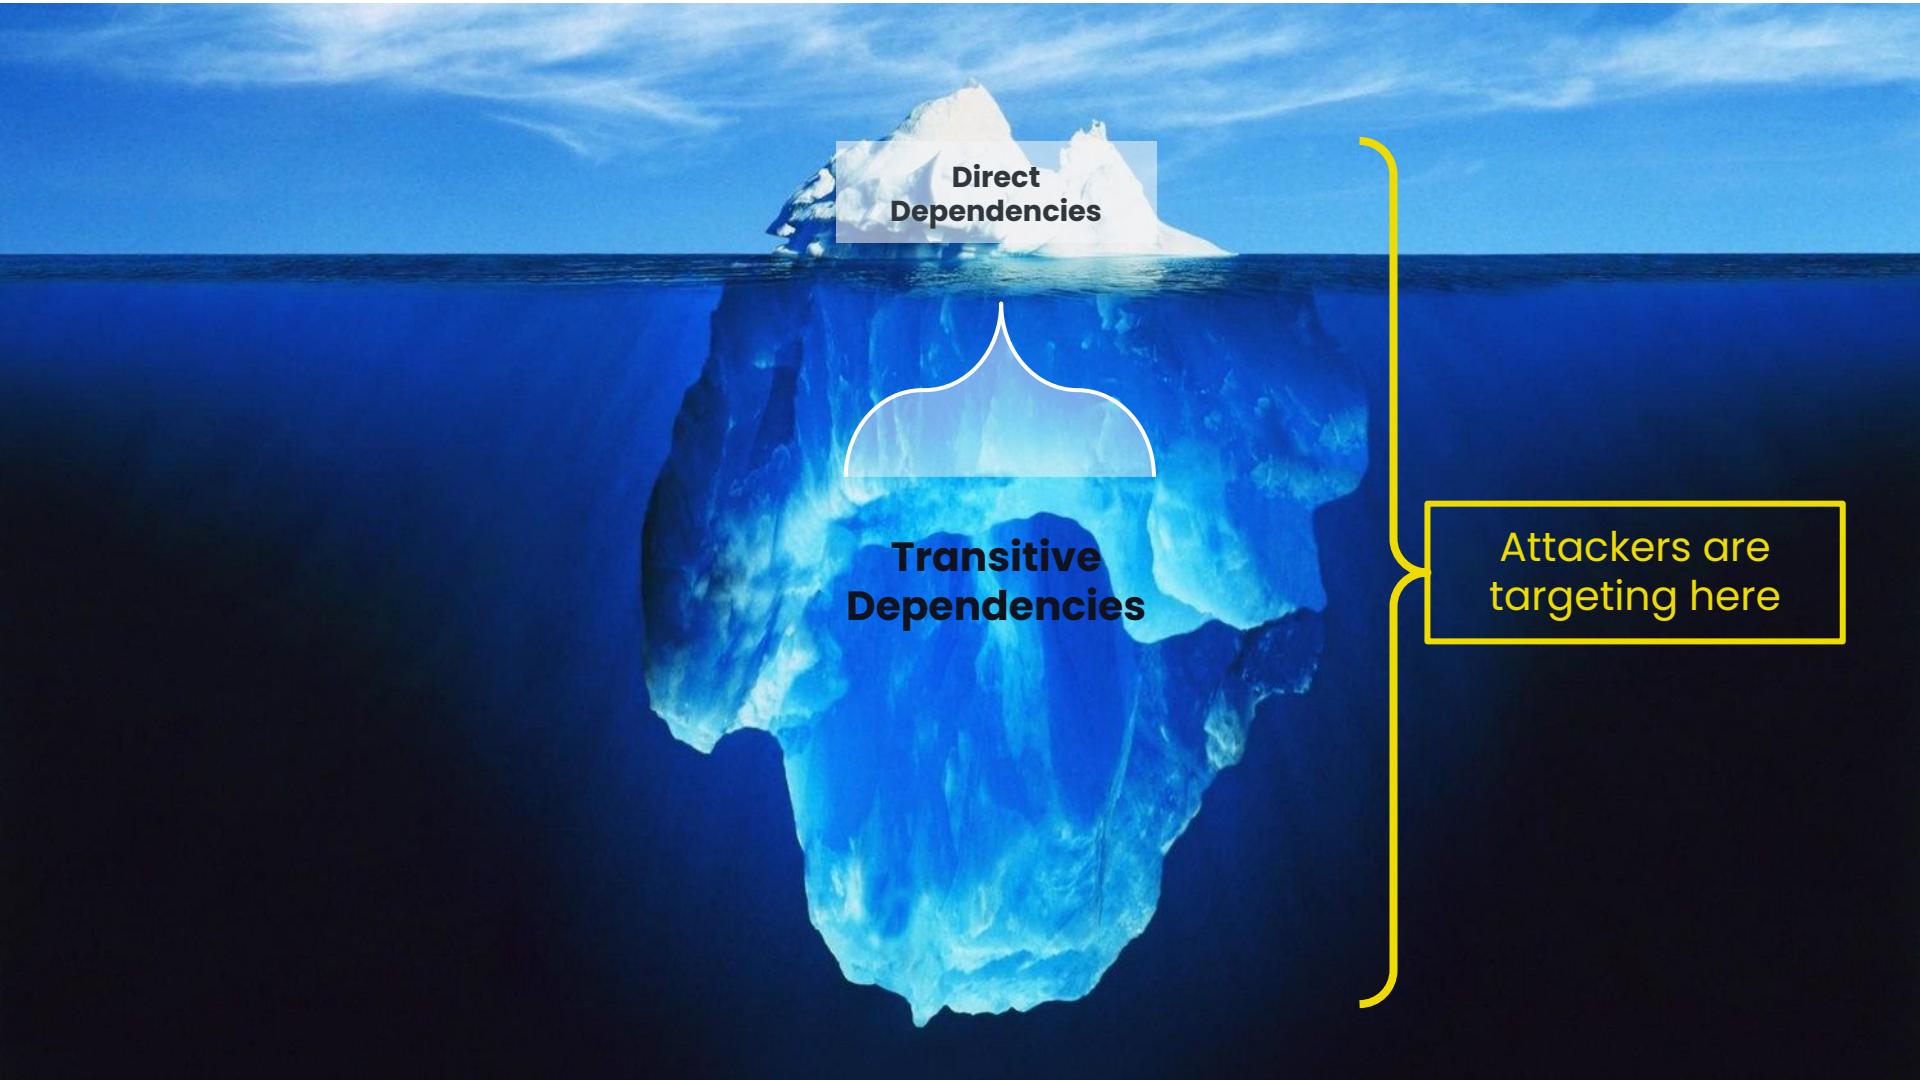

Risk in the Software Supply Chain

Free is Just the Tip of the Iceberg: Open Source Library System Software

Lori Bowen Ayre
lori.ayre@galecia.com
METRO Webinar
October 6, 2009

Direct
Dependencies

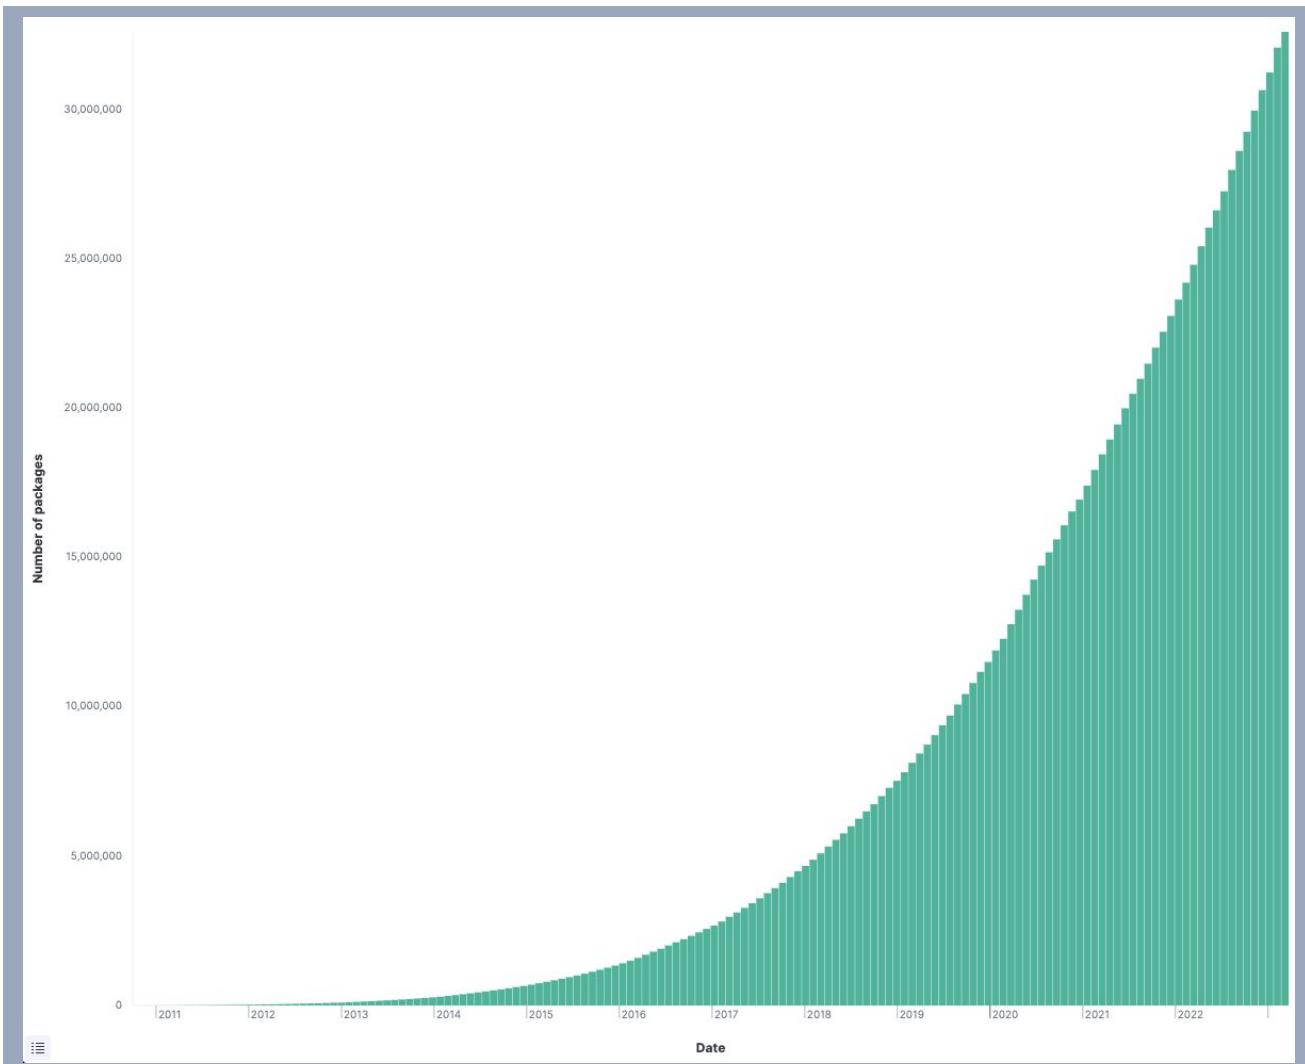

Transitive
Dependencies

Attackers are
targeting here

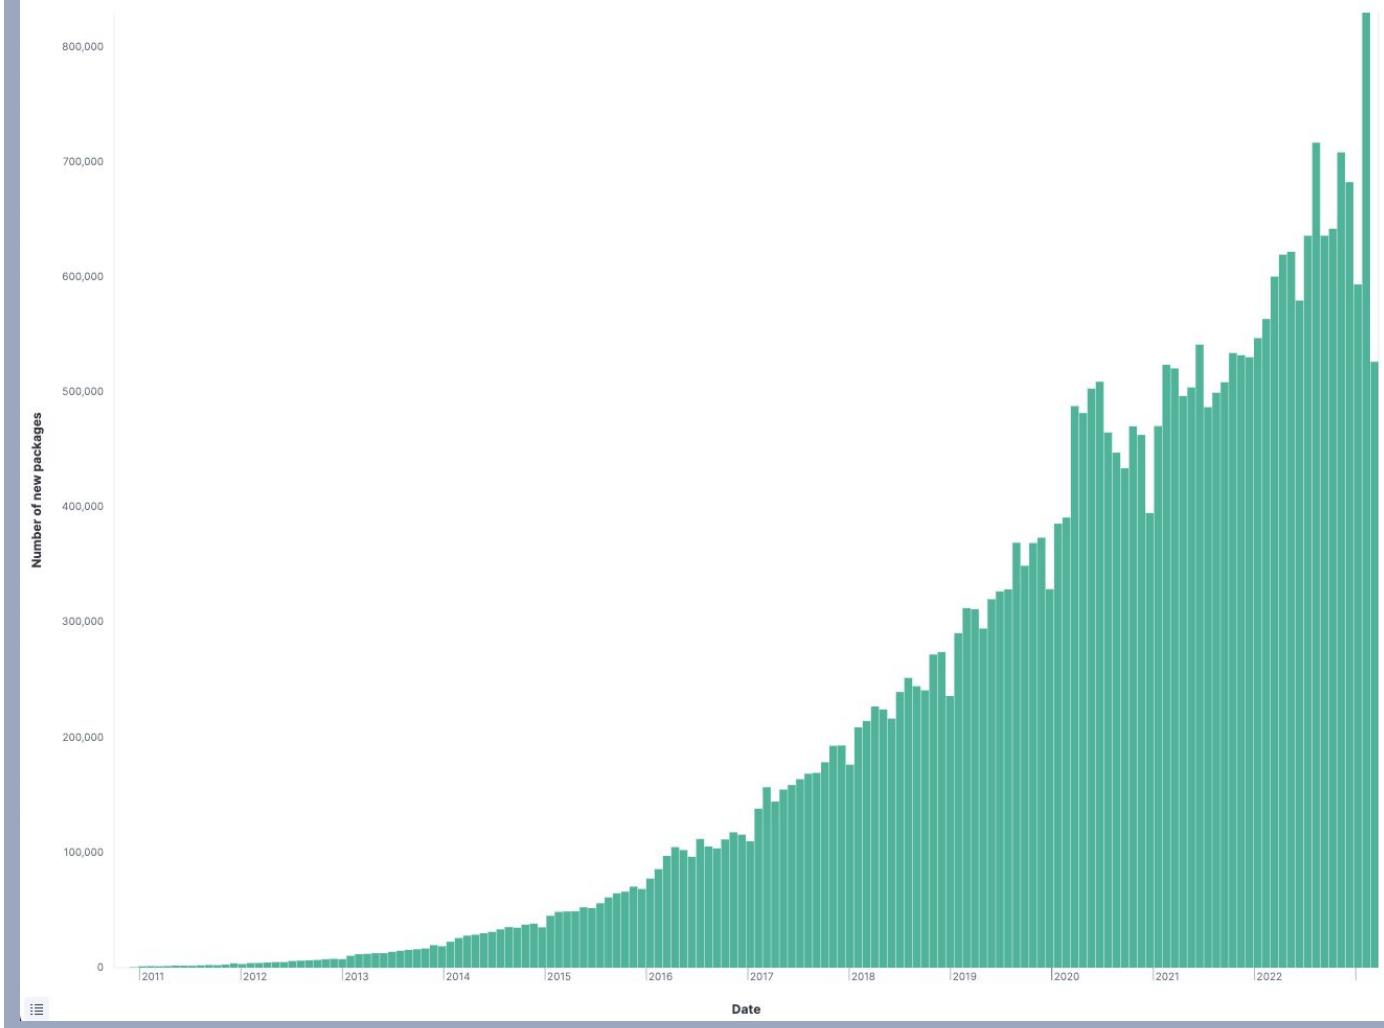

This metaphor...

- You've seen this iceberg metaphor. I've used this metaphor 100 times, I've criticized this metaphor.
- This is an OLD metaphor
- Things have changed a lot but we're still thinking about old systems
- <https://www.slideshare.net/loriayre/open-source-library-system-software-free-is-just-the-tip-of-the-iceberg>
- They're attacking the bottom now - that's a supply chain attack
- But really, the top isn't "your code" - the top is your direct dependencies, bottom is transitive
- You can only directly control what's at the top
- They're attacking the whole iceberg, but you probably only know about the stuff at the top
- The change is largely due to the massive rise in software package managers
- The CVE system predates this change and hasn't really evolved

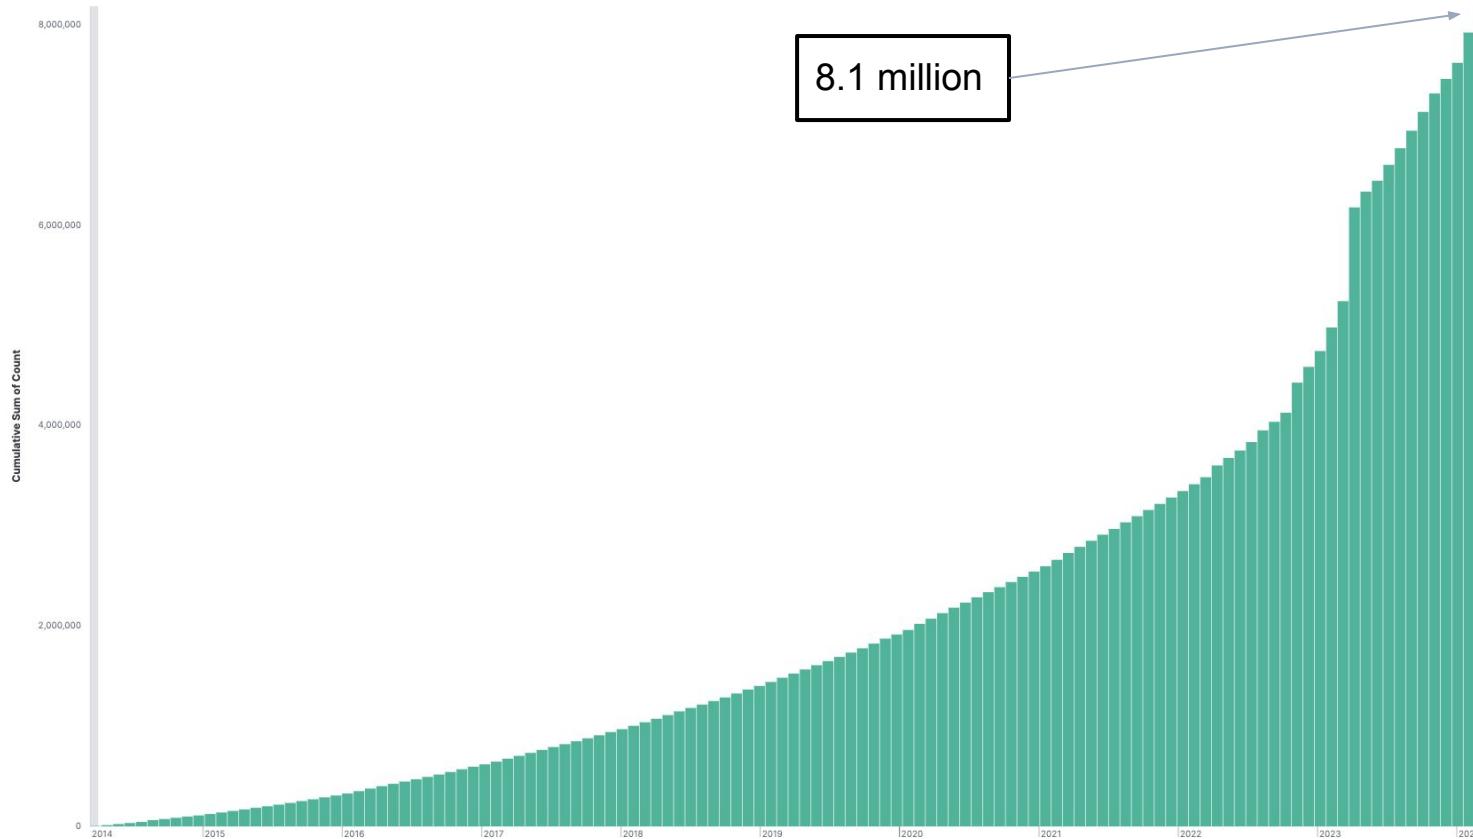

Number of NPM packages

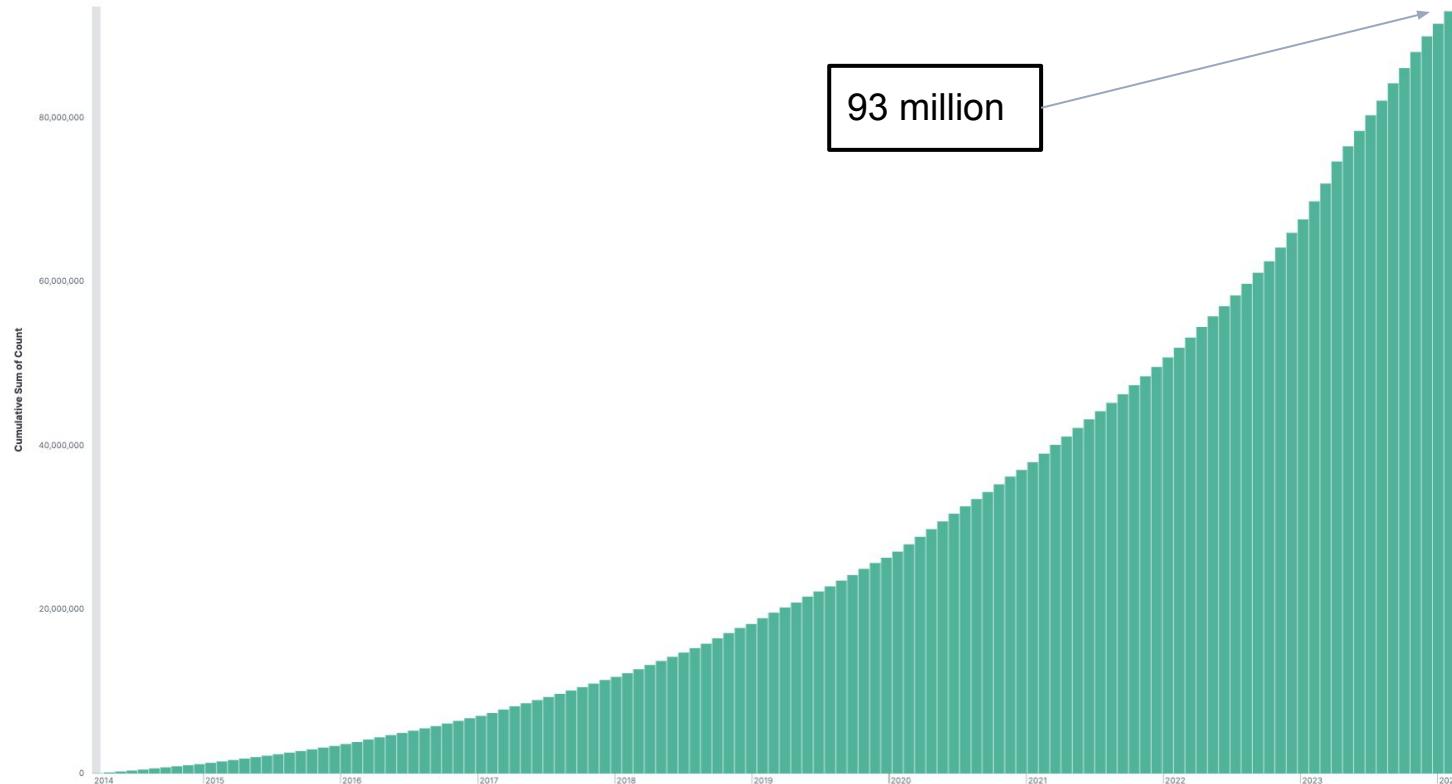

Number of NEW packages

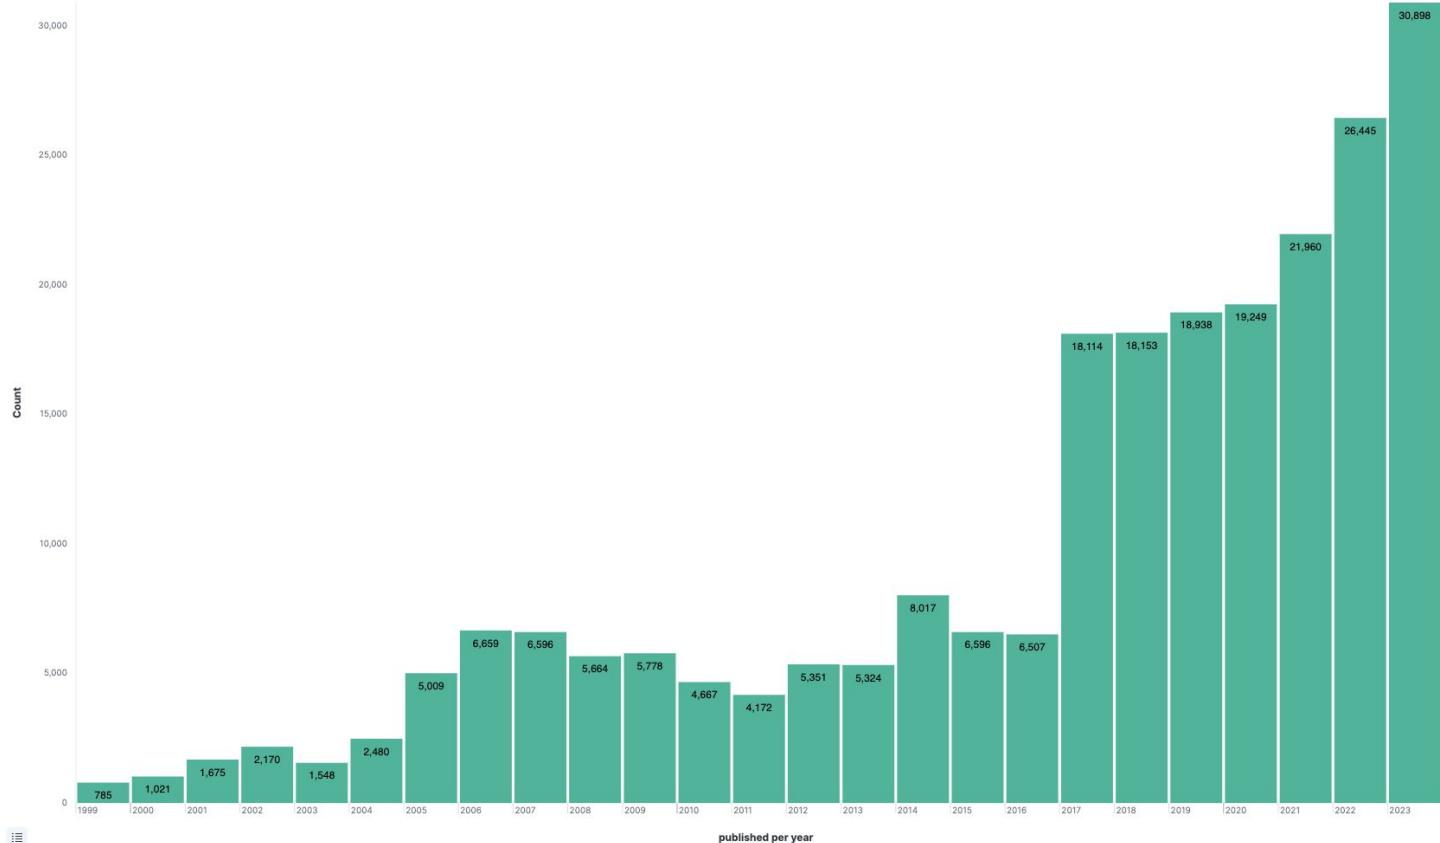

How big is big? (all packages over time)

How big is big? (all versions of all packages)

Also CVE growth

Open source is huge

- NPM introduced 2010
- 43 million packages (as of April)
- Approx 1,000,000 new packages **per month**
- That's just NPM!

npmjs.org

3,732,919 packages

42,958,444 versions

850,084 maintainers

231,488 namespaces

752,313 keywords

256,314,168,001 downloads

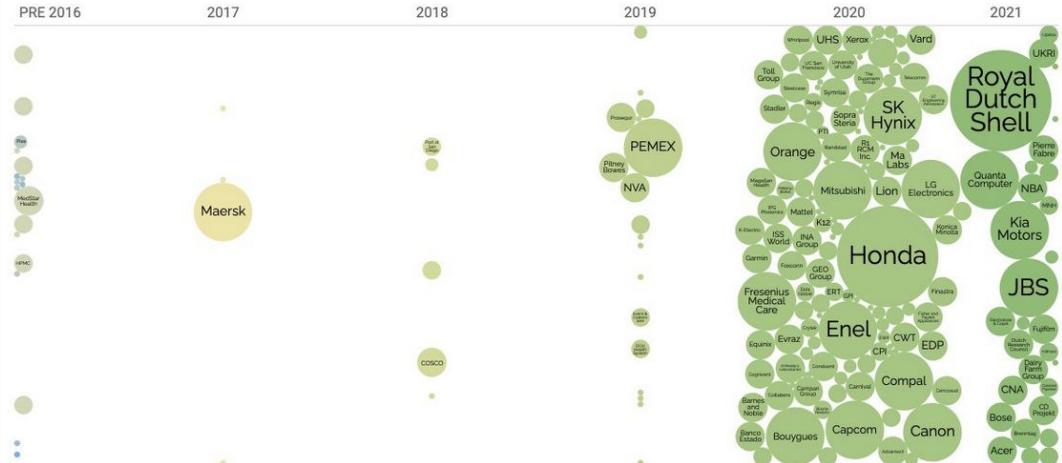

...

Are #Ransomware attacks increasing? I think #Ransomware attacks are increasing...

interactive: bit.ly/3h1lYPs

Ransomware Attacks

size = size of organisation

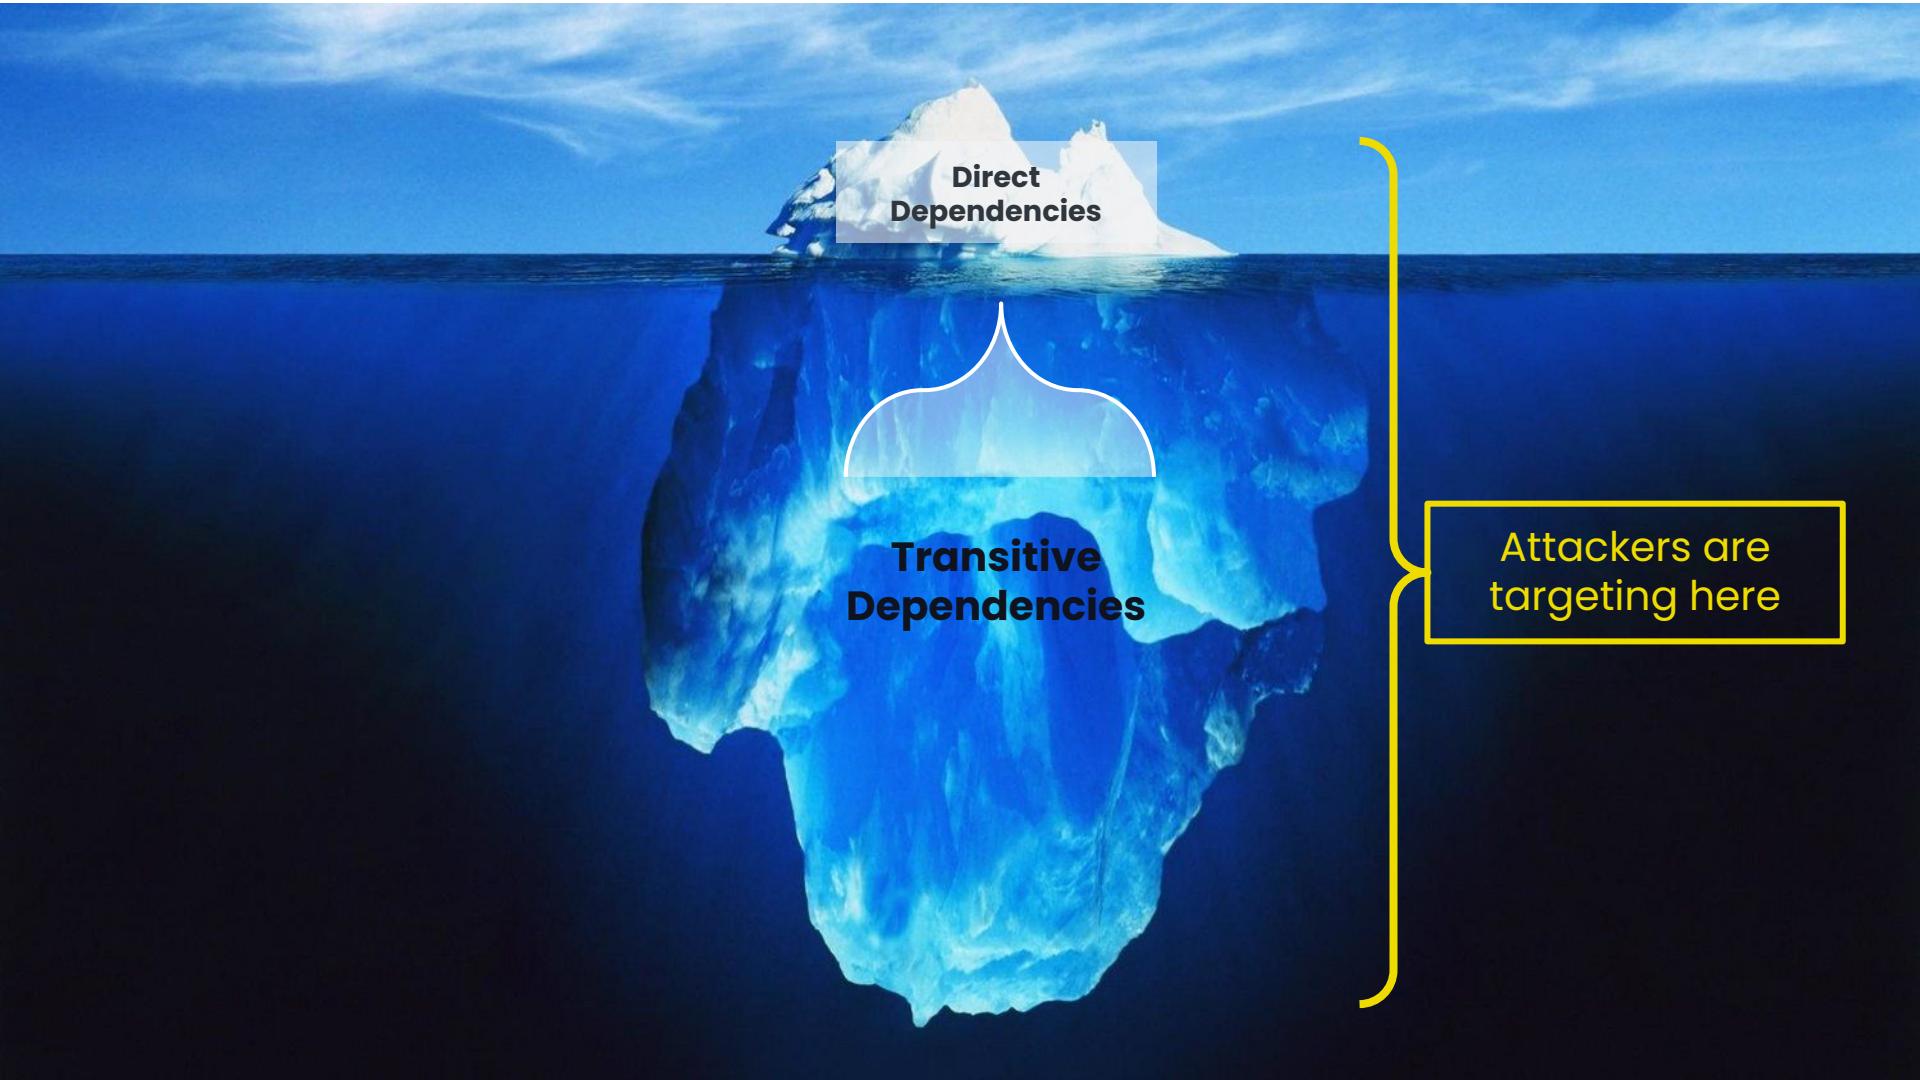

Davit + 4 | © Indless, Swanuja Masteekar
Information is Beautiful

sources: bleeping computer, zdnet, forbes, BBC & other news reports // 23rd June 2021

The predictable consequence

- Ransomware has exploded along with transitive dependencies and open source in general
- I don't believe in coincidences

Direct
Dependencies

Transitive
Dependencies

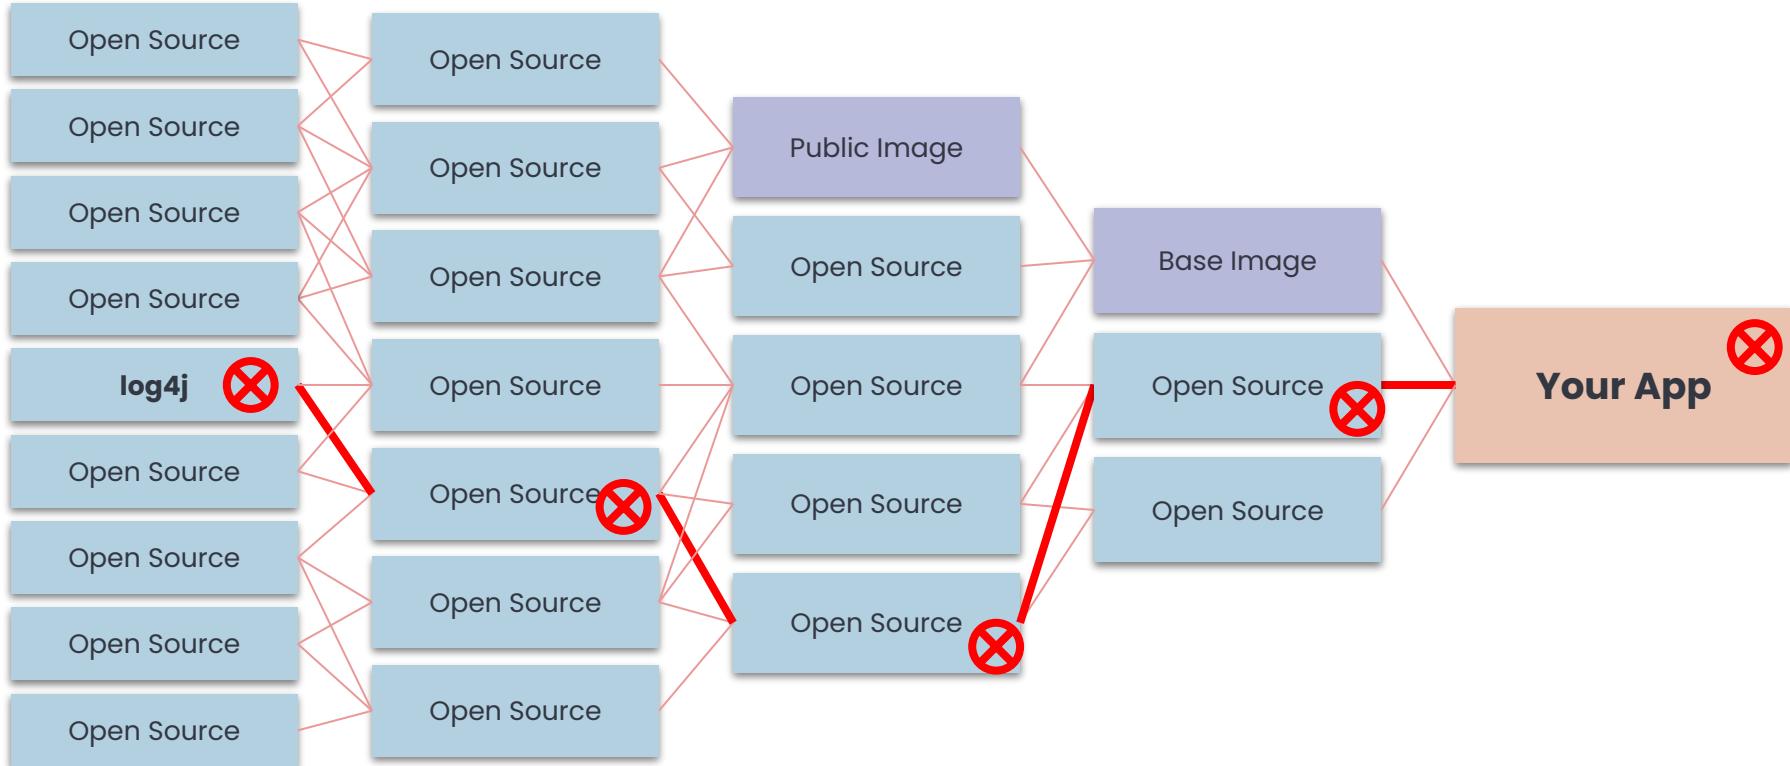

Attackers are
targeting here

If We Knew What We are Consuming

- People spent insane amounts of time just finding log4j, because nobody knew where (or even if) it was hiding
- Knowing = Faster Remediation
- SBOMs help, a LOT, but... “a phone book is not illuminating”
 - They aren’t a silver bullet
 - Scanners aren’t perfect (e.g. can’t penetrate binary blobs, cf. OpenSSL3.)
 - Not all SBOMs are equal
 - SBOMs aren’t ubiquitous (yet) (producers aren’t reliably supplying them)
 - SBOMs are more accurate and useful when producers/maintainers generate them
BUT something is better than nothing
 - SBOM management is hard
 - Any SBOM generated before an actual build is suspect (transitive deps)
 - SBOM Everywhere: <https://github.com/ossf/sbom-everywhere>
 - I don’t know what the end game is but generating them is better than nothing, figure out the details later

Software “Supply” Chains

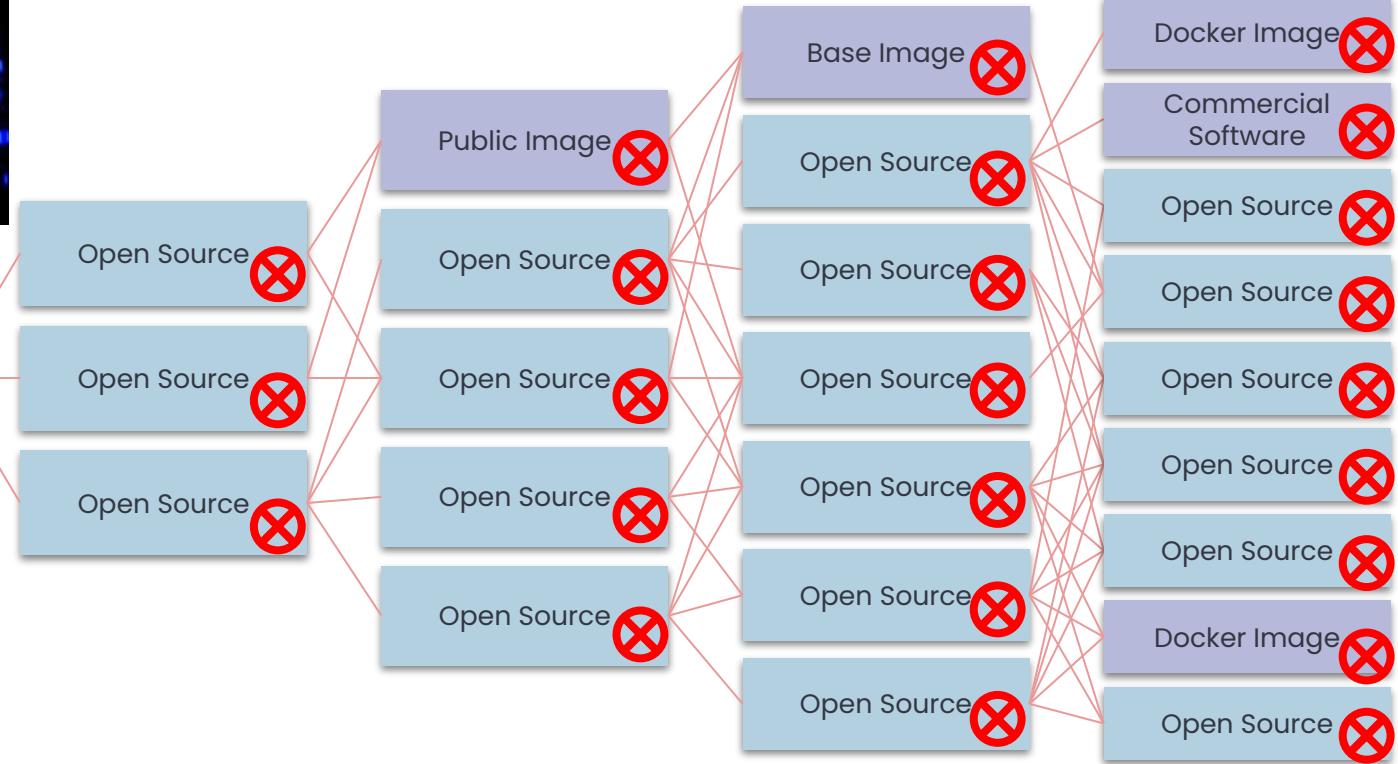

Software “Supply” Chain: The ~~Iceberg~~ Funnel

The Reverse Funnel

Compromised Package

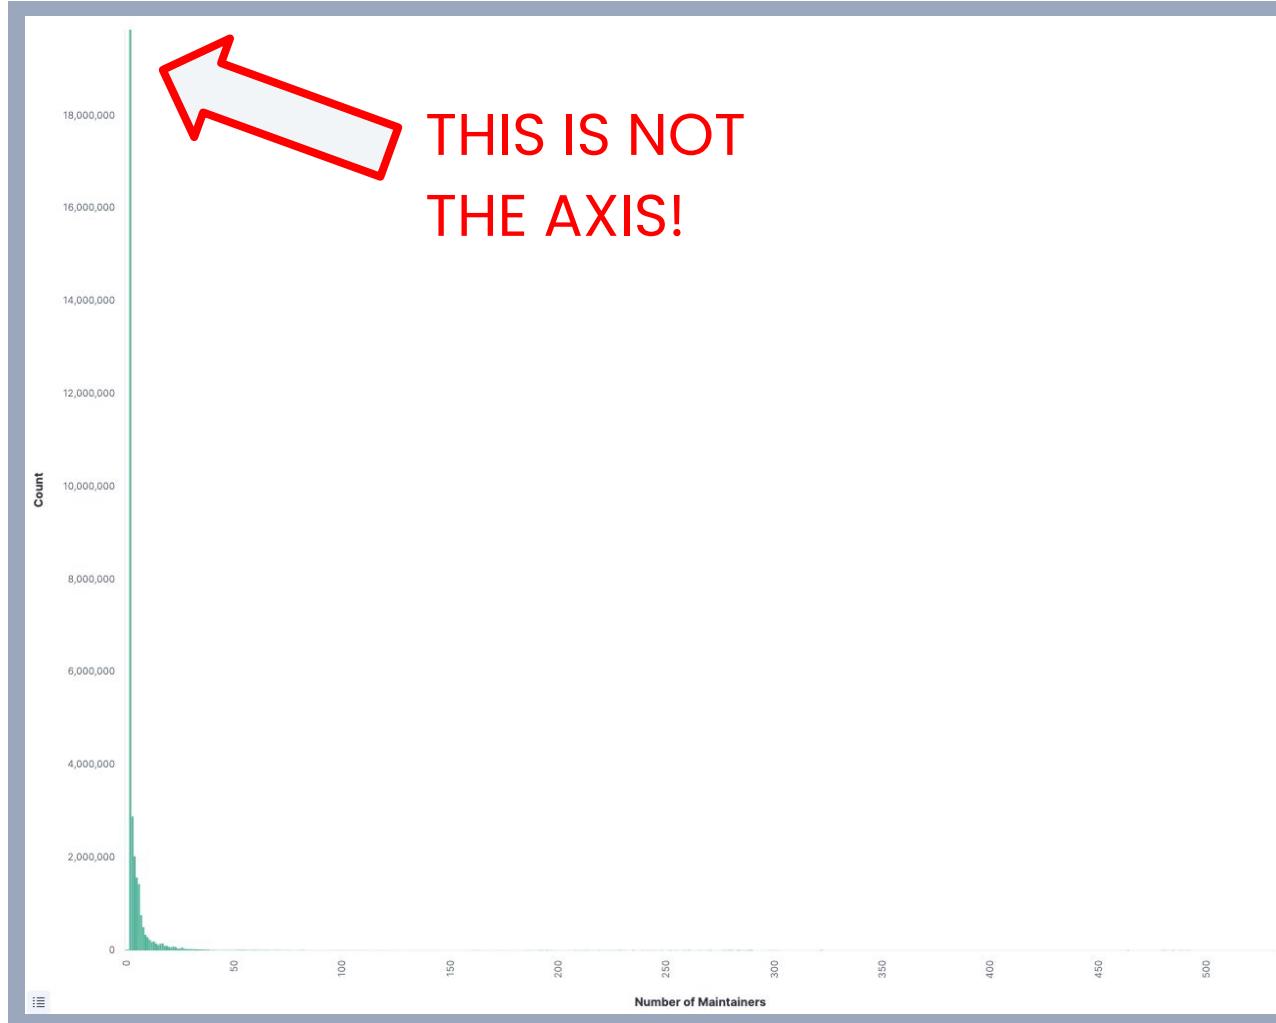

What is an SBOM?

An Example Project Health Metric:

Number of
Maintainers

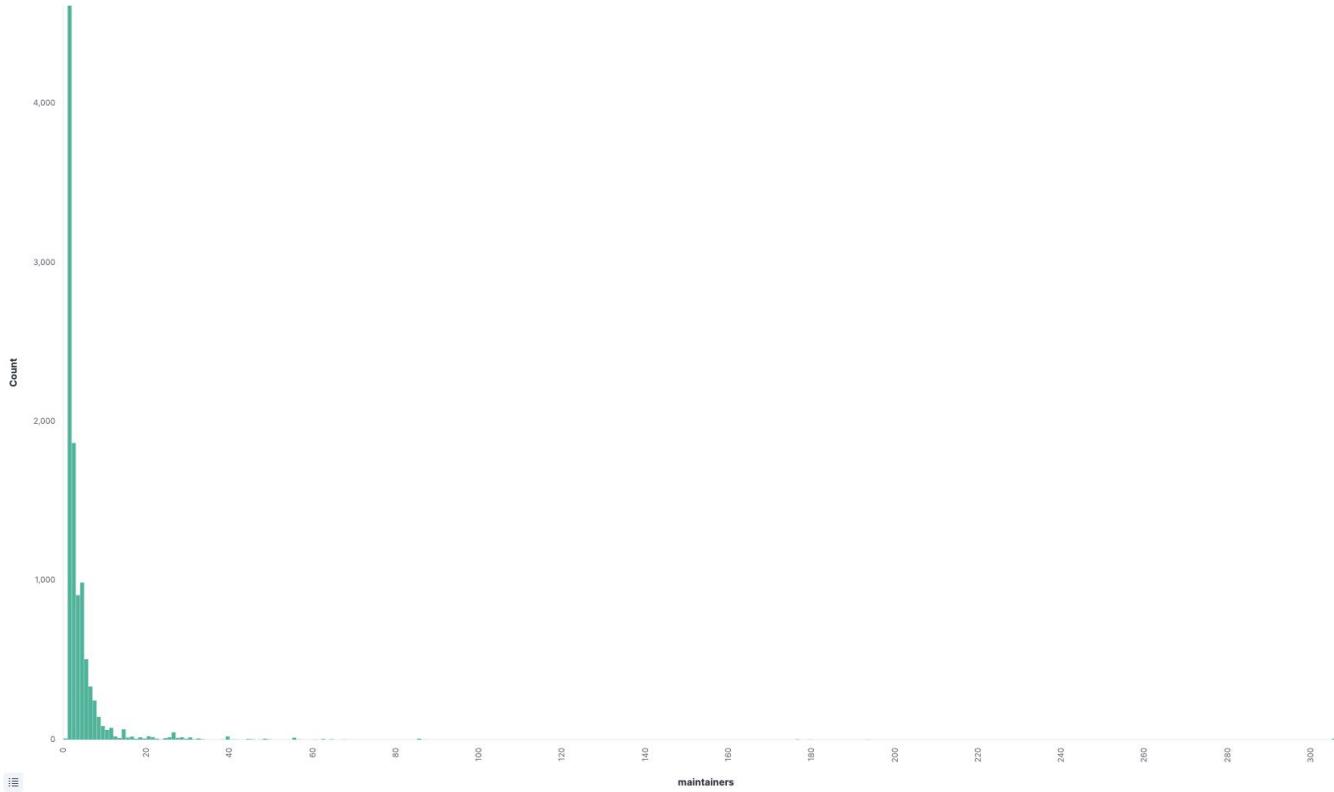

How many people are maintaining these things?

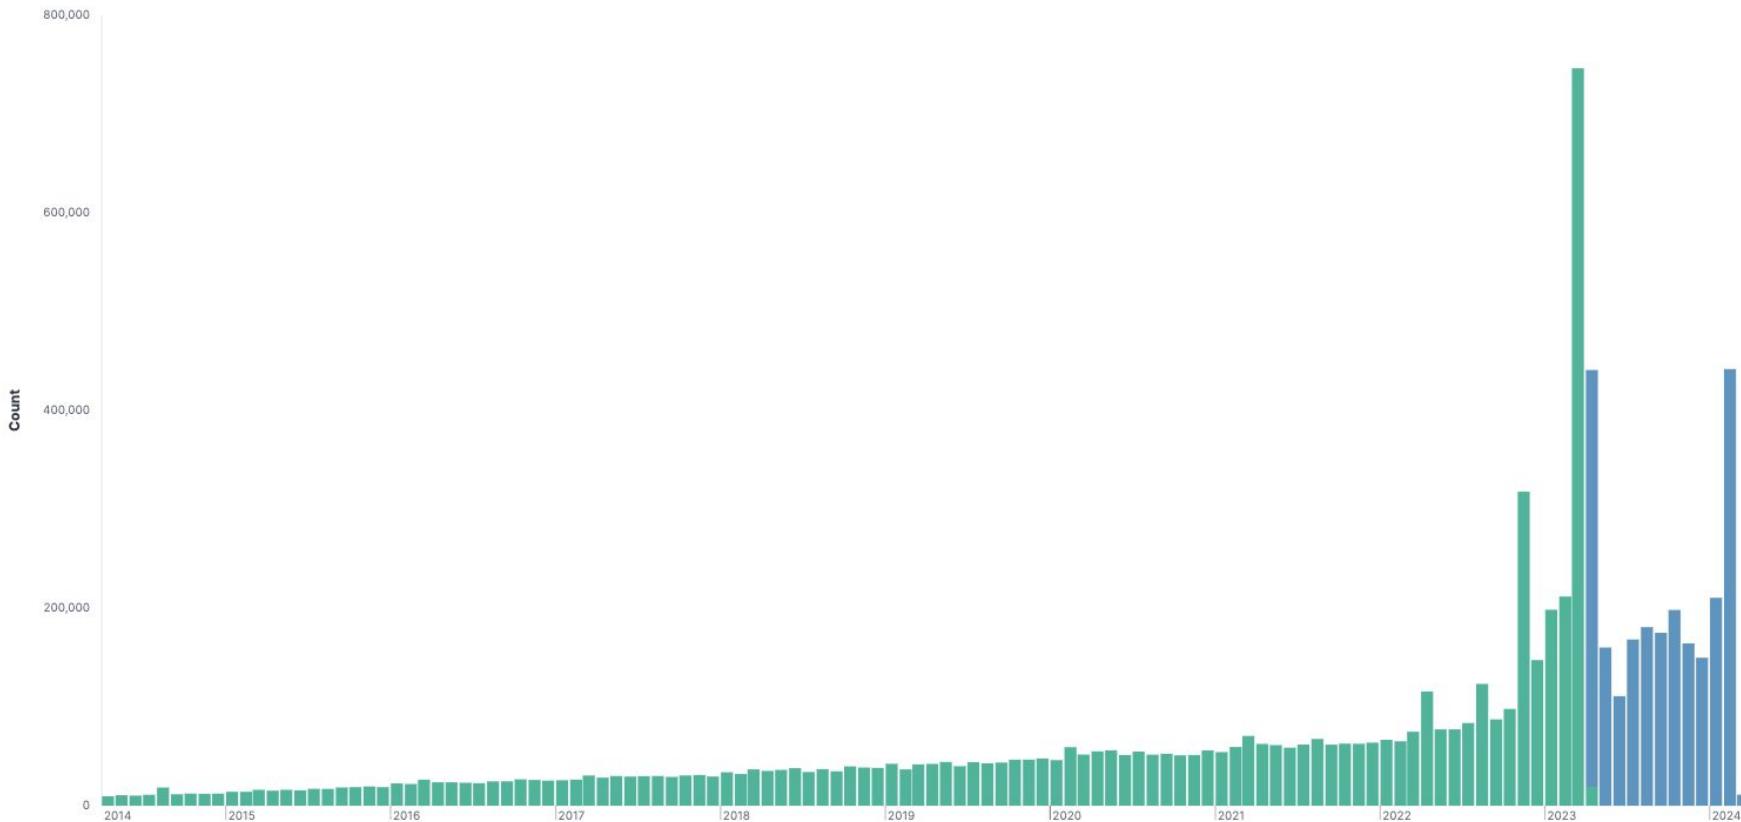

› 100,000 downloads

> 1,000,000 downloads

How many packages are more than a year old?

daniel:// stenberg://

@bagder

...

If you are a multi billion dollar company and are concerned about log4j, why not just email OSS authors you never paid anything and demand a response for free within 24 hours with lots of info? (company name redacted for *my* peace of mind)

Dear Haxx Team Partner,

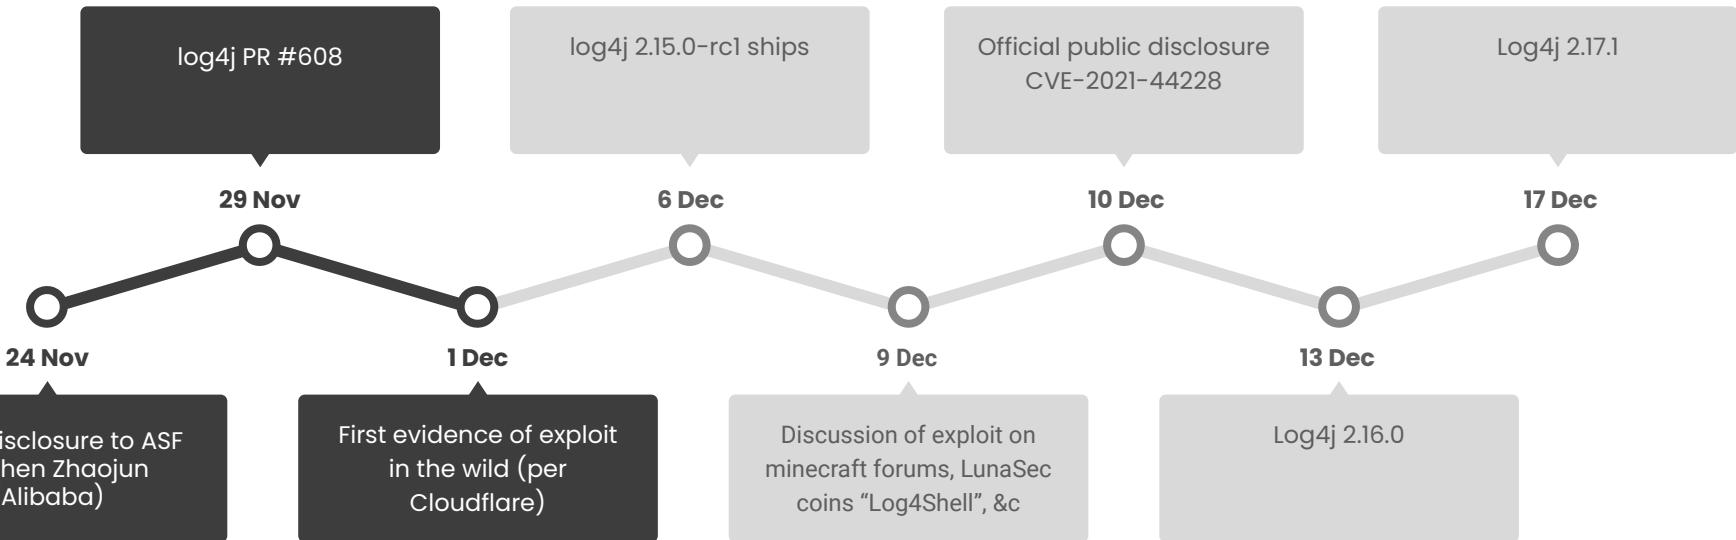

You are receiving this message because [REDACTED] uses a product you developed. We request you review and respond within 24 hours of receiving this email. If you are not the right person, please forward this message to the appropriate contact.

As you may already be aware, a newly discovered zero-day vulnerability is currently impacting Java logging library Apache Log4j globally, potentially allowing attackers to gain full control of affected servers.

The security and protection of our customers' confidential information is our top priority. As a key partner in serving our customers, we need to understand your risk and mitigation plans for this vulnerability.

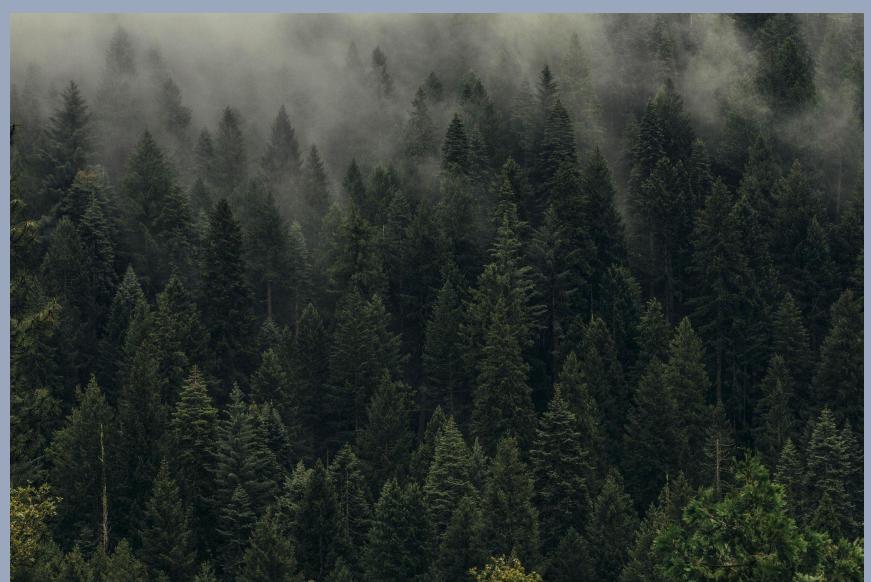

Please respond to the following questions using the template provided below.

log4shell Timeline

Stop thinking about open source like a vendor

This

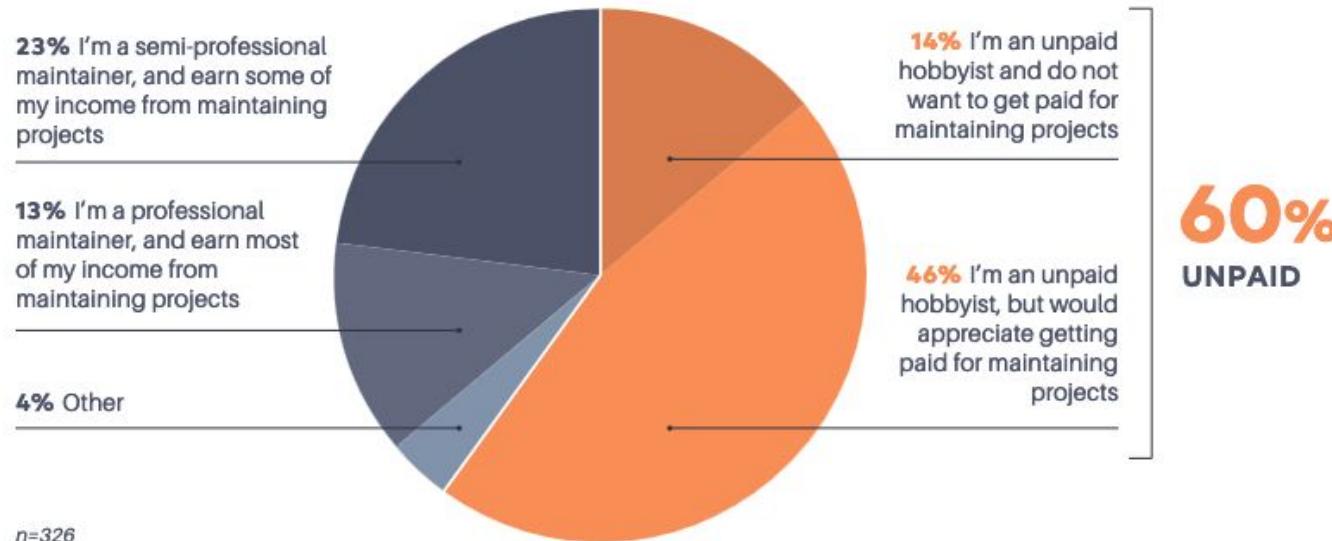

Not this

Who is doing this?

60% of maintainers describe themselves as unpaid hobbyists

Which of the following phrases best describes how you approach your role as an open source maintainer?

Credit: Tidelift 2023 Open Source Maintainer Survey

Summary of Software Supply Chains

- Red Hat is a supplier - they assume responsibility in exchange for money
- npm is NOT a supplier
- A lot of critical plumbing is maintained by unpaid guys who have day jobs, take vacations, etc.

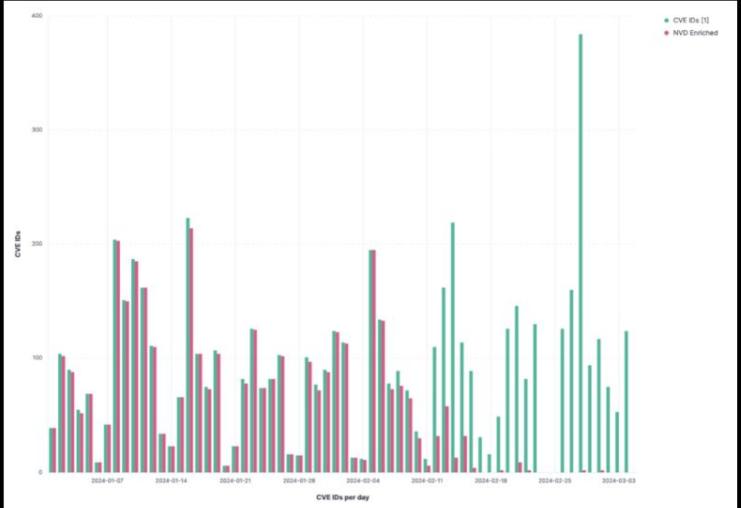

New Developments

Three Big Things

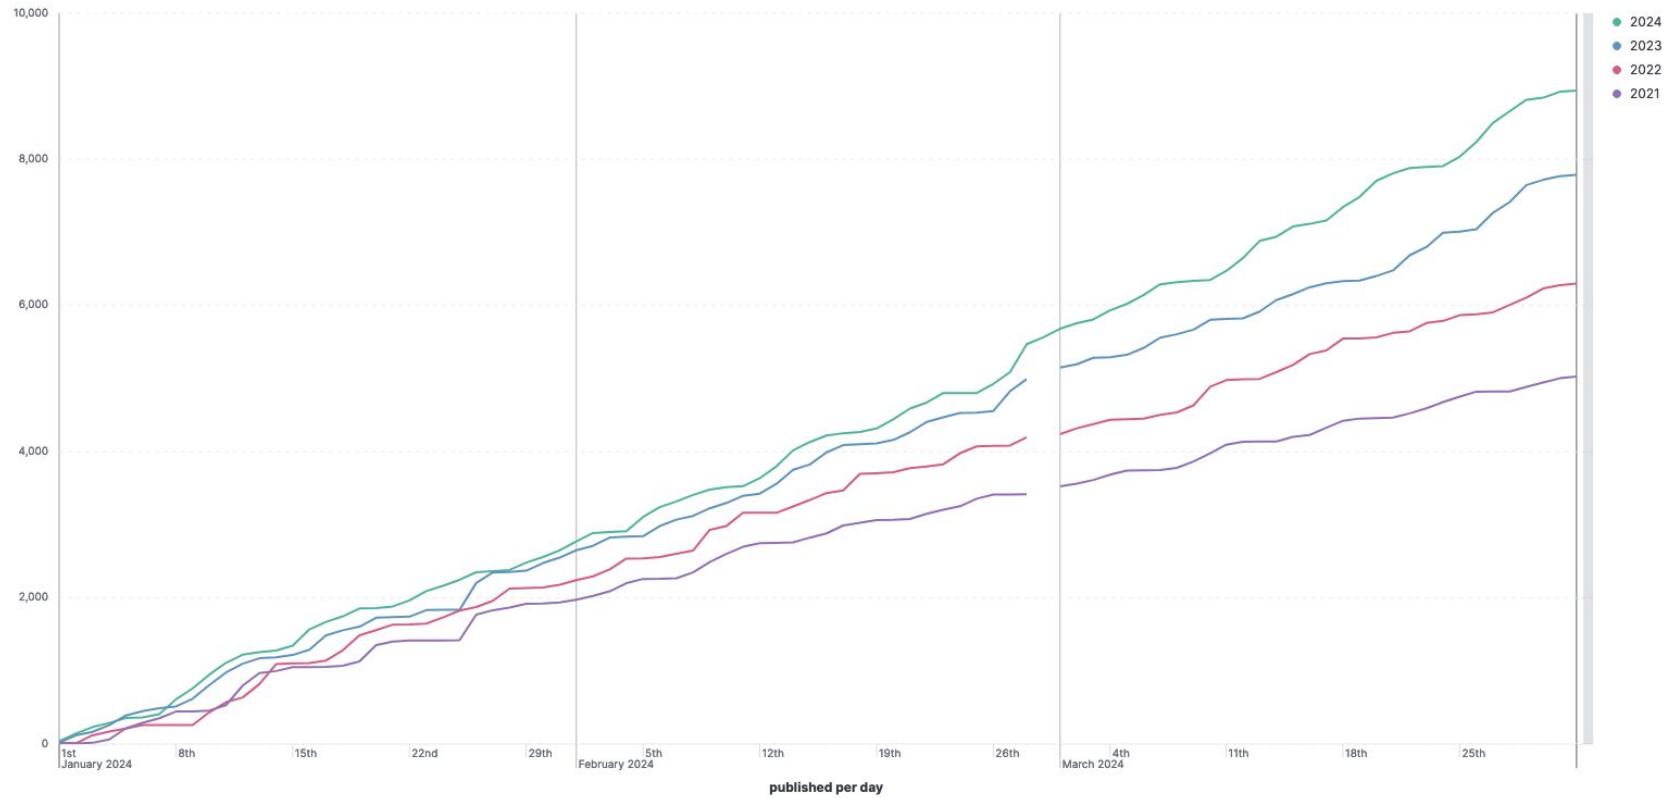

CVE-2020-19909

On August 25 2023, we got [an email to the curl-library mailing list](#) from Samuel Henrique that informed us that “someone” had recently created a CVE, a security vulnerability identification number and report really, for a curl problem.

I wanted to let you know that there's a recent curl CVE published and it doesn't look like it was acknowledged by the curl authors since it's not mentioned in the curl website: CVE-2020-19909

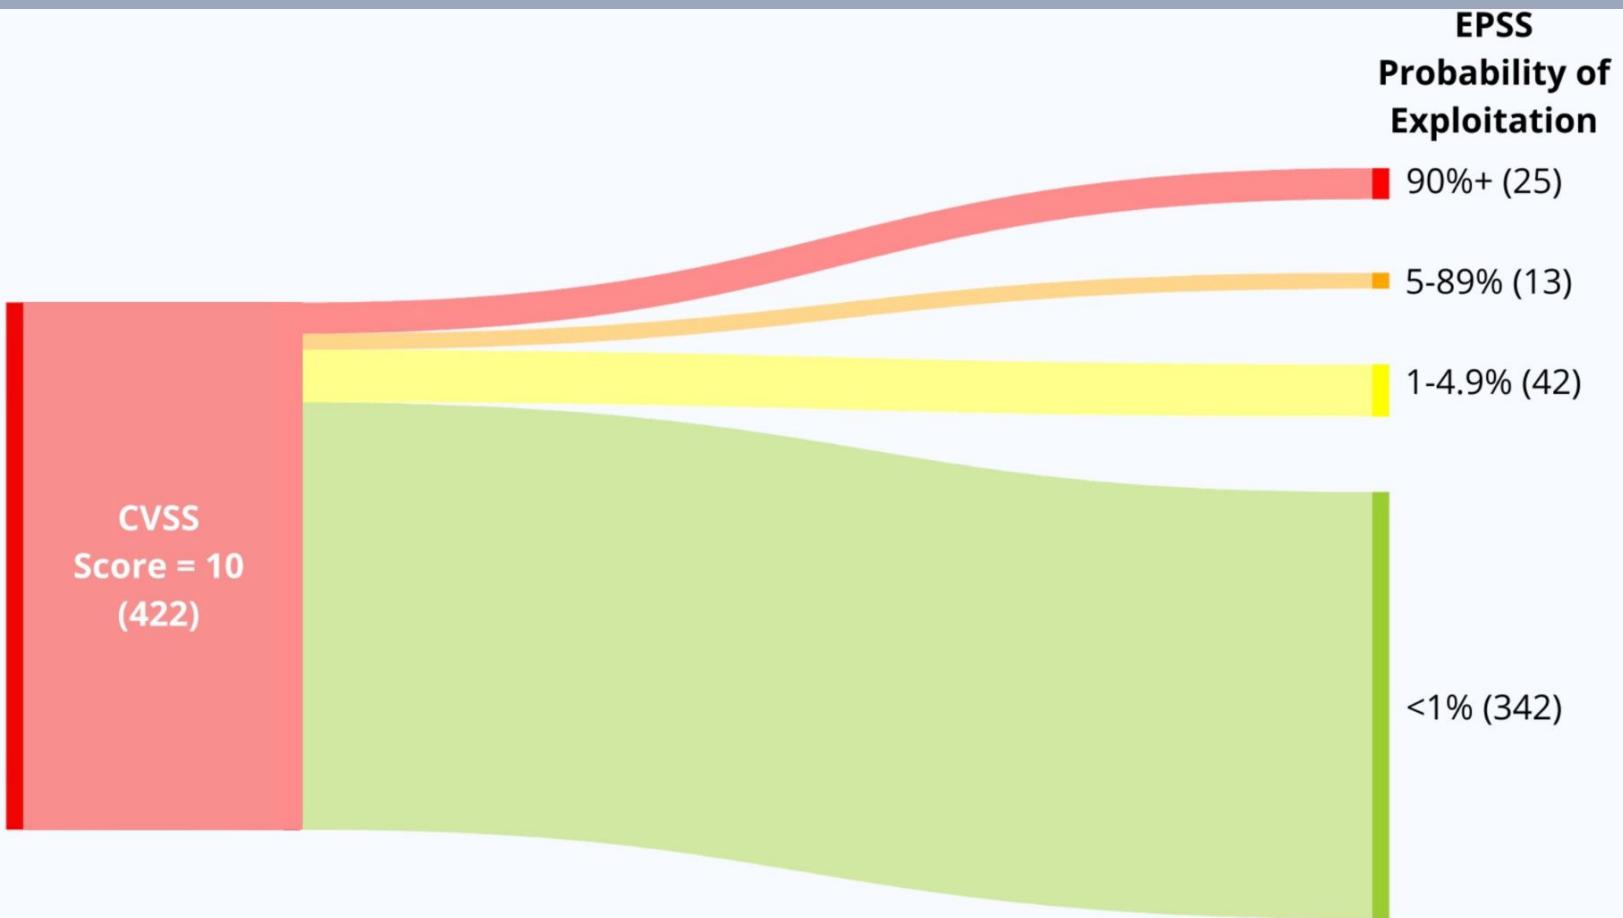

We can't tell who filed it. We just know that it is now there.

CVE by year

Big Thing #1: If Not CVE/cvss, Then What?

- GHSAs (more transparent than CVEs)
- CISA KEV, EPSS, VEX, CSAF, &c
- OpenSSF Malicious Packages Repository
- GitHub Insights and other project health metrics
 - This is (currently) a very manual process
 - But it's getting a lot easier

Big Thing #2: Project Health/Insights

- This is PROACTIVE (the better advisory data, scoring etc is about reactive improvements)
- This is (currently) a manual process (getting easier)
- Evaluating project health isn't directly about safety, it's about tracking all of those deps in the iceberg,
- Are the projects you're depending on healthy, will you be able to work with them?

#2113 merged 8 hours ago

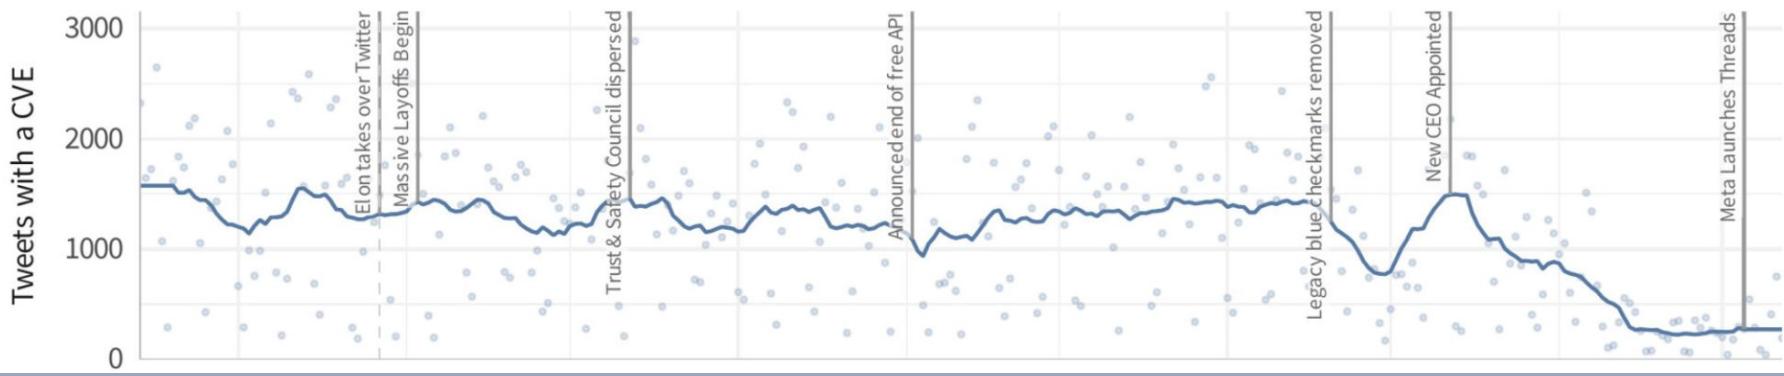

Big Thing #3: Supply Chain Attacks Ascendant

- Open Source has gotten so big that opportunistic, financially-motivated attackers are extremely incentivized to focus on it
- Supply chain attacks are reusable
- Even state-sponsored attackers can't ignore it
- Scale means that it's often useful even to get to particular targets

Bonus Thing: Infosec Twitter is Dead

- Twitter was incredibly central to Log4Shell reaction, forming consensus, and generally just figuring out what was happening
- If log4shell dropped today, this reaction/recovery would be notably worse because of infosec splintering to (e.g.) mastodon, linkedin, bsky, threads
- None of these networks have the critical mass that Twitter had and it doesn't seem to be improving

Infosec Twitter activity: Sep 13, 2022 to July 12, 2023

This seems really bad

1. Well it's not great
2. But things are mostly working OK
3. Open source adapts

Open source is different

There's nothing wrong with open source, this is how it works

There's something wrong with what we expect from open source

Big Changes

1. Better metrics and data sources are coming
2. Tracking dependencies is more proactive
3. Supply chain attacks are here to stay
4. Twitter is Over

Call to Action

SBOM Everywhere: <https://github.com/ossf/sbom-everywhere>

I don't know what the end game is but generating them is better than nothing, figure out the details later

The (first two) "big things" are still very embryonic and probably not ready for prime time but tools are starting to adopt a lot of this

SBOMs: <https://github.com/anchore/syft>

Vulnerabilities: <https://github.com/anchore/grype>

Webinars: <https://anchore.com/webinars/>

Recap

- Log4Shell is radioactive and immortal
- How software gets made has changed
- We don't know what's in our software
- We don't know who is supplying it
- We have to change how we evaluate it
- GitHub is uniquely positioned
- Try to be proactive

SBOM Takeaways

00

SBOMs enable continuous, automated security/compliance checks, reduce time spent identifying and remediating issues

01

SBOMs improve a lot of things but do not solve every problem you have

02

Log4j is extremely easy to find, OpenSSL 3 is often obscured

03

SBOMs are more effective when created by maintainers rather than consumers, but something is better than nothing
